## Search

KMA Solaiman – [ksolaima@umbc.edu](mailto:ksolaima@umbc.edu)

# A General Searching Algorithm

Core ideas:

1. Maintain a list of **frontier (fringe)** nodes
  1. Nodes coming *into* the frontier have been explored
  2. Nodes *going out* of the frontier have not been explored
2. Iteratively select nodes from the frontier and explore unexplored nodes from the frontier
3. Stop when you reach your **goal**

Figure 3.3

# State-space search algorithm

*;; problem describes the start state, operators, goal test, and operator costs*

*;; queueing-function is a comparator function that ranks two states*

*;; general-search returns either a goal node or failure*

```
function general-search (problem, QUEUEING-FUNCTION)
  nodes = MAKE-QUEUE (MAKE-NODE (problem.INITIAL-STATE) )
  loop
    if EMPTY(nodes) then return "failure"
    node = REMOVE-FRONT(nodes)
    if problem.GOAL-TEST (node.STATE) succeeds
      then return node
    nodes = QUEUEING-FUNCTION (nodes, EXPAND (node,
      problem.OPERATORS) )
  end
```

*;; Note: The goal test is NOT done when nodes are generated*

*;; Note: This algorithm does not detect loops*

# State Space Graphs and Search Trees

# State Space Graphs

- State space graph: A mathematical representation of a search problem
  - Nodes are (abstracted) world configurations
  - Arcs represent transitions/ successors (action results)
  - The goal test is a set of goal nodes (maybe only one)
- In a state space graph, each state occurs only once!
- We can rarely build this full graph in memory (it's too big), but it's a useful idea

*Tiny state space graph for a tiny search problem*

# State Space Graphs vs. Search Trees

State Space Graph

*Each NODE in in the search tree is an entire PATH in the state space graph.*

*We construct the tree on demand – and we construct as little as possible.*

Search Tree

# Informed vs. uninformed search

## Uninformed search strategies (blind search)

- Use no information about likely *direction* of a goal
- Methods: breadth-first, depth-first, depth-limited, uniform-cost, depth-first iterative deepening, bidirectional

## Informed search strategies (heuristic search)

- Use information about domain to (try to) (usually) head in the general direction of goal node(s)
- Methods: hill climbing, best-first, greedy search, beam search, algorithm A, algorithm A\*

# Evaluating search strategies

- **Completeness**
  - Guarantees finding a solution whenever one exists
- **Time complexity** (worst or average case)
  - Usually measured by *number of nodes expanded*
- **Space complexity**
  - Usually measured by maximum size of graph/tree during the search
- **Optimality/Admissibility**
  - If a solution is found, is it **guaranteed** to be an optimal one, i.e., one with minimum cost

# Example of uninformed search strategies

Consider this search space where S is the start node and G is the goal. Numbers are arc costs.

# Classic uninformed search methods

- The four classic uninformed search methods
  - Breadth first search (BFS)
  - Depth first search (DFS)
  - Uniform cost search (*generalization of BFS*)
  - Iterative deepening (*blend of DFS and BFS*)
- To which we can add another technique
  - Bi-directional search (*hack on BFS*)

# Breadth-First Search

*Strategy: expand a shallowest node first*

*Implementation:  
Frontier is a FIFO queue*

  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$
- Is it complete?

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$
- Is it complete?
  - $s$  must be finite if a solution exists, so yes!

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$
- Is it complete?
  - $s$  must be finite if a solution exists, so yes!
- Is it optimal?

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$
- Is it complete?
  - $s$  must be finite if a solution exists, so yes!
- Is it optimal?
  - If costs are equal for each operator (e.g., 1)

# Breadth-First Search (BFS) Properties

- What nodes does BFS expand?
  - Processes all nodes above shallowest solution
  - Let depth of shallowest solution be  $s$
  - Search takes time  $O(b^s)$
- How much space does the frontier take?
  - Has roughly the last tier, so  $O(b^s)$
- Is it complete?
  - $s$  must be finite if a solution exists, so yes!
- Is it optimal?
  - If costs are equal for each operator (e.g., 1)

Potential issues??

# Breadth-First Search

- Takes a **long time to find solutions** with large number of steps because must explore all shorter length possibilities first

# Breadth-First Search

**Long time to find solutions** with many steps: we must look at all shorter length possibilities first

- Complete search tree of depth  $d$  where nodes have  $b$  children has  $1 + b + b^2 + \dots + b^d = (b^{d+1} - 1)/(b - 1)$  nodes =  $O(b^d)$
- Tree of depth 12 with branching 10 has more than a trillion nodes
- If BFS expands 1000 nodes/sec and nodes uses 100 bytes, then it may take 35 years to run and uses 111 terabytes of memory!

- How much space does the frontier take?
  - Only has siblings on path to root, so  $O(bm)$
- Is it complete?
  - $m$  could be infinite

Can find **long solutions quickly** if lucky (and **short solutions slowly** if unlucky!)

# Depth-First Search (DFS) Properties

- What nodes does DFS expand?
  - Some left prefix of the tree down to depth  $m$ .
  - Could process the whole tree!
  - If  $m$  is finite, takes time  $O(b^m)$
- How much space does the frontier take?
  - Only has siblings on path to root, so  $O(bm)$
- Is it complete?
  - $m$  could be infinite
  - preventing cycles may help

Can find **long solutions quickly** if lucky (and **short solutions slowly** if unlucky!)

# Depth-First Search (DFS) Properties

- What nodes does DFS expand?
  - Some left prefix of the tree down to depth  $m$ .
  - Could process the whole tree!
  - If  $m$  is finite, takes time  $O(b^m)$
- How much space does the frontier take?
  - Only has siblings on path to root, so  $O(bm)$
- Is it complete?
  - $m$  could be infinite
  - preventing cycles may help
  - **May not terminate** w/o depth bound, i.e., ending search below fixed depth  $D$  (depth-limited search)

Can find **long solutions quickly** if lucky (and **short solutions slowly** if unlucky!)

# Depth-First Search (DFS) Properties

- What nodes does DFS expand?
  - Some left prefix of the tree down to depth  $m$ .
  - Could process the whole tree!
  - If  $m$  is finite, takes time  $O(b^m)$
- How much space does the frontier take?
  - Only has siblings on path to root, so  $O(bm)$
- Is it complete?
  - $m$  could be infinite
  - preventing cycles may help
  - **May not terminate** w/o depth bound, i.e., ending search below fixed depth  $D$  (depth-limited search)
- Is it optimal?

Can find **long solutions quickly** if lucky (and **short solutions slowly** if unlucky!)

# Depth-First Search (DFS) Properties

- What nodes does DFS expand?
  - Some left prefix of the tree down to depth  $m$ .
  - Could process the whole tree!
  - If  $m$  is finite, takes time  $O(b^m)$

- How much space does the frontier take?
  - Only has siblings on path to root, so  $O(bm)$

- Is it complete?
  - $m$  could be infinite
  - preventing cycles may help
  - **May not terminate** w/o depth bound, i.e., ending search below fixed depth  $D$  (depth-limited search)

- Is it optimal?
  - No, it finds the “leftmost” solution, regardless of depth or cost

Can find **long solutions quickly** if lucky (and **short solutions slowly** if unlucky!)

# Breadth-First Search

$\{ G^{21} G^{13} \}$

*Notation*

**$G^{18}$**

G is node; 18 is  
cost of shortest  
known path from  
start node S

Note: we typically don't check for goal until we expand node

Solution path found is S A G , cost 18

Number of nodes expanded (including goal node) = 7

# Depth-First Search

Expanded node	Nodes list
	$\{ S^0 \}$
$S^0$	$\{ A^3 B^1 C^8 \}$
$A^3$	$\{ D^6 E^{10} G^{18} B^1 C^8 \}$

- Is it complete?
  - Assuming  $C^*$  is finite and  $\epsilon > 0$ , yes!
- Is it optimal?
  - Yes! (Proof next lecture via A\*)

# Depth-First Iterative Deepening (DFID)

- Do DFS to depth 0, then (if no solution) DFS to depth 1, etc.
- Usually used with a tree search
- **Complete**
- **Optimal/Admissible** if all operators have unit cost, else finds shortest solution (like BFS)
- Time complexity a bit worse than BFS or DFS  
Nodes near top of search tree generated many times, but since almost all nodes are near tree bottom, worst case time complexity still exponential,  $O(b^d)$

# Depth-First Iterative Deepening (DFID)

- If branching factor is  $b$  and solution is at depth  $d$ , then nodes at depth  $d$  are generated once, nodes at depth  $d-1$  are generated twice, etc.
  - Hence  $b^d + 2b^{(d-1)} + \dots + db \leq b^d / (1 - 1/b)^2 = O(b^d)$ .
  - If  $b=4$ , worst case is  $1.78 * 4^d$ , i.e., 78% more nodes searched than exist at depth  $d$  (in worst case)
- **Linear space complexity**,  $O(bd)$ , like DFS
- Has advantages of BFS (completeness) and DFS (i.e., limited space, finds longer paths quickly)
- Preferred for **large state spaces** where **solution depth is unknown**

# How they perform

- **Depth-First Search:**

- 4 Expanded nodes: S A D E G
- Solution found: S A G (cost 18)

- **Breadth-First Search:**

- 7 Expanded nodes: S A B C D E G
- Solution found: S A G (cost 18)

- **Uniform-Cost Search:**

- 7 Expanded nodes: S A D B C E G
- Solution found: S C G (cost 13)

*Only uninformed search that worries about costs*

- **Iterative-Deepening Search:**

- 10 nodes expanded: S S A B C S A D E G
- Solution found: S A G (cost 18)

# Searching Backward from Goal

- Usually a successor function is reversible
  - i.e., can generate a node's predecessors in graph
- If we know a single goal (rather than a goal's properties), we could search backward to the initial state
- It might be more efficient
  - Depends on whether the graph fans in or out

# Bi-directional search

- Alternate searching from the start state toward the goal and from the goal state toward the start
- Stop when the frontiers intersect
- Works well only when there are unique start & goal states
- Requires ability to generate “predecessor” states
- Can (sometimes) lead to finding a solution more quickly

# Comparing Search Strategies

Criterion	Breadth-First	Uniform-Cost	Depth-First	Depth-Limited	Iterative Deepening	Bidirectional (if applicable)
Time	$b^d$	$b^d$	$b^m$	$b^l$	$b^d$	$b^{d/2}$
Space	$b^d$	$b^d$	$bm$	$bl$	$bd$	$b^{d/2}$
Optimal?	Yes	Yes	No	No	Yes	Yes
Complete?	Yes	Yes	No	Yes, if $l \geq d$	Yes	Yes

# Summary

- Search in a problem space is at the heart of many AI systems
- Formalizing the search in terms of **states**, **actions**, and **goals** is key
- The simple “uninformed” algorithms we examined can be augmented to heuristics to improve them in various ways
- But for some problems, a simple algorithm is best
